SYSTEM AND METHOD FOR FILLING OUT FORMS

ABSTRACT OF THE DISCLOSURE

A system and method are provided for filling out forms. The system includes a processor circuit in a server having a processor and a memory. The system also includes a form profile database stored in the memory, the form profile database including a form profile associated with a user, the form profile having a number of data fields. Logic is stored in the memory and executable by the processor to define a form that includes a subset of the number of data fields. Also, logic is stored in the memory and executable by the processor to transmit the form to a client in response to a request from the client. The system may also include logic to verify the identity of a user that requests the form. The system provides several benefits, including that fact that a client can automatically download their personal information for a specific entity without having to fill the same information out in one or more forms. The information downloaded is far less subject to error as it is entered only once and saved in the server.
